In the past few weeks, the number of districts reporting zero COVID-19 cases over a period of 7 days has decreased markedly. In parallel, the COVID-19 incidence has risen in many federal states. This trend is concerning.

The cumulative nationwide incidence over the past 7 days was 6.1 cases per 100,000 inhabitants and thus further increased slightly, albeit at a low level. A total of 57 districts transmitted zero cases over the past 7 days. In a further 213 districts the 7-day-incidence is below 5.0/100,000 inhabitants.

In total, 214,214 laboratory-confirmed COVID-19 cases and 9,183 deaths due to COVID-19 have been electronically reported to the RKI in Germany.

In the Bavarian district of Dingolfing-Landau a COVID-19 related outbreak occurred with >400 cases among harvest workers of an agricultural company and among employees of a canning company.

Moreover, further COVID-19-related outbreaks are being reported in various settings, including nursing homes and hospitals, facilities for asylum-seekers and refugees, meat-processing plants and other occupational settings, educational settings, as well as in the context of religious or family events.

COVID-19 cases are notified to the local public health department in the respective districts, in accordance with the German Protection against Infection Act (IfSG). The data are further transmitted through the respective federal state health authority to the Robert Koch Institute (RKI). This situation report presents the uniformly recorded nationwide data on laboratory-confirmed COVID-19 cases transmitted to RKI.

Summary (as of 07/08/2020 12:00 AM)

- In the past few weeks, the number of districts reporting zero COVID-19 cases over a period of 7 days has decreased markedly. In parallel, the COVID-19 incidence has risen in many federal states. This trend is concerning.
- The cumulative nationwide incidence over the past 7 days was 6.1 cases per 100,000 inhabitants and thus further increased slightly, albeit at a low level. A total of 57 districts transmitted zero cases over the past 7 days. In a further 213 districts the 7-day-incidence is below 5.0/100,000 inhabitants.
- In total, 214,214 laboratory-confirmed COVID-19 cases and 9,183 deaths due to COVID-19 have been electronically reported to the RKI in Germany.
- In the Bavarian district of Dingolfing-Landau a COVID-19 related outbreak occurred with >400 cases among harvest workers of an agricultural company and among employees of a canning company.
- Moreover, further COVID-19-related outbreaks are being reported in various settings, including nursing homes and hospitals, facilities for asylum-seekers and refugees, meat-processing plants and other occupational settings, educational settings, as well as in the context of religious or family events.
Epidemiological Situation in Germany

**General current assessment**

The increase in the number of reported COVID-19 cases over the past weeks can be observed in many of the federal states.

Nationwide, there are many smaller case outbreaks in different administrative districts in various settings, such as larger family events, leisure activities, occupational settings, but also in community and health facilities. In addition, COVID-19 cases are increasingly being identified among people returning from travel abroad.

The number of new cases reported daily has been increasing since calendar week 30. This development is very concerning and will continue to be monitored very closely by the RKI. A further worsening of the situation must be avoided. This will only succeed if the entire population continues to be committed to decreasing transmission, e.g. by consistently observing rules of physical distancing and hygiene - also in outdoor settings -, by airing indoor areas and, where indicated, wearing a community or face mask correctly.

**Geographical distribution of cases**

Epidemiological analyses are based on validated cases notified electronically to the RKI in line with the Protection Against Infection Law (Data closure: 12:00 AM daily). Since January 2020, a total of 214,214 (+1,147) laboratory-confirmed cases of COVID-19 have been electronically reported to and validated by the RKI (see Table 1). A total of 57 districts reported no cases in the past 7 days. In the past few weeks, the number of districts not transmitting any COVID-19 cases over a period of 7 days decreased continuously, from a maximum of 125 districts on 12/07/2020.
**Figure 1:** Number and cumulative incidence (per 100,000 population) of the 214,214 electronically reported COVID-19 cases in Germany by county and federal state (07/08/2020, 00:00 AM). Please see the COVID-19 dashboard (https://corona.rki.de/) for information on number of COVID-19 cases by county (local health authority).
Table 1: Number and cumulative incidence (per 100,000 population) of laboratory-confirmed COVID-19 cases and deaths for each federal state electronically reported to RKI, Germany (07/08/2020, 12:00 AM). The number of new cases covers positive cases, which have been sent to the local health department at the same day, but also at previous days.

Quality checks and data cleaning by the health authorities and regional offices can lead to corrections to cases previously transmitted (e.g. detection of duplicate reports). This can occasionally lead to negative values for the number of new cases.

**Distribution of cases over time**

The first COVID-19 cases in Germany were notified in January 2020. Figure 2 shows COVID-19 cases transmitted to RKI according to date of illness onset from 01/03/2020 onwards. Of these cases, the onset of symptoms is unknown in 67,423 cases (31%), thus their date of reporting is provided in Figure 2.
Demographic distribution of cases

Of all notified cases, 51% are female and 49% are male. Among all those notified cases, for which data on age and gender were reported, 6,475 were children under 10 years of age (3.0%), 11,716 children and teenagers aged 10 to 19 years (5.5%), 96,045 persons aged 20 to 49 years (45%), 62,771 persons aged 50 to 69 years (29%), 31,250 persons aged 70 to 89 years (15%) and 5,484 persons aged 90 years and older (2.6%). The age and/or gender was unknown in 473 notified cases. Cases had a mean age of 47 years (median age 47 years). The highest incidences are seen in persons aged 90 years and older (Figure 3).

Clinical aspects

Information on symptoms is available for 181,433 (85%) of the notified cases. Commonly reported symptoms were cough (47%), fever (40%) and rhinorrhoea (21%). Pneumonia was reported in 5,306 cases (3.0%). Since calendar week 17, cases are reported to the RKI as a distinct COVID-19 surveillance
category. Since then, ageusia and anosmia can also be entered as symptoms. At least one of these two symptoms was reported in 5,616 of 37,266 cases (15%).

Hospitalisation was reported for 31,032 (17%) of 186,331 COVID-19 cases with information on hospitalisation status.

Approximately 195,900 people have recovered from their COVID-19 infection. Since the exact date of recovery is unknown in most cases, an algorithm was developed to estimate this number.

A total of 9,183 COVID-19-related deaths have been reported in Germany (4.3% of all confirmed cases). Of these, 5,081 (55%) are men and 4,098 (45%) are women (see Table 2), the gender was unknown in five cases.

The median age of COVID-19 cases reported to have died was 82 years. Of all deaths, 7,848 (85%) were in people aged 70 years or older, but only 17% of all cases were in this age group. Thus far, three deaths among COVID-19 cases under 20 years of age have been reported to the RKI. Pre-existing medical conditions were reported for all three.

Table 2: Number of notified COVID-19 deaths by age group and gender electronically reported to RKI (Data available for 9,179 of notified deaths; 07/08/2020, 12:00 AM)

Occupation, accommodation or care in facilities

In accordance with the Protection Against Infection Act, the RKI receives information on occupation, accommodation or care in a facility relevant for infection control for reported COVID-19 cases. Since information on occupation, accommodation or care in these facilities is missing in 25% of cases, the proportion of cases working, accommodated or cared for in these facilities reported here should be considered minimum values. Among the COVID-19 cases reported from the above mentioned facilities, the proportion of cases that actually acquired their infection in these facilities is unknown.
The number of COVID-19 cases was highest among persons cared for or employed in medical and other care facilities according to §23 and §36 IfSG (Table 3). The number of deaths was particularly high among persons cared for in these facilities.

Among the cases reported as working in medical facilities, 73% were female and 27% male. Their median age was 41 years. The high number of cases among people cared for or working in various care facilities (Section 36 IfSG) is consistent with numerous reported outbreaks, especially in nursing homes. The low number of cases among persons who attend or work in facilities providing child care or education (Section 33 IfSG) reflects the low incidence in children observed thus far. The increase in the number of cases among persons working in the food sector (§42) is largely due to outbreaks in meat processing plants.

**Outbreaks**

Five districts reported an increased incidence of >25 cases in 7 days/100,000 inhabitants: the districts of Dingolfing-Landau in Bavaria, the district of Rheingau-Taunus and the city Offenbach in Hesse, the district of Vechta in Lower Saxony and the district of Kleve in North Rhine-Westphalia.

A high 7-day incidence with more than 100 cases per 100,000 inhabitants was observed in the district of Dingolfing-Landau. The increase is due to two outbreaks with >400 COVID-19-cases, one among harvest workers of an agricultural company and the other among employees in two of three locations of a
canning company. Quarantine was ordered for all employees of both companies. The local population (3,300 inhabitants) has been offered voluntary testing.

In the district of Offenbach the increase in case numbers is predominantly due to cases among returning travelers. In the district of Kleve transmission among guests of a large wedding party play contributed to the increase in case numbers. The sharp increase in the number of COVID-19 cases in the district of Rheingau-Taunus-Kreis is explained by an outbreak in an nursing home as well as cases among returning travellers.

Further COVID-19 outbreaks continue to be reported in nursing homes and hospitals, refugee facilities, meat-processing plants and other occupational settings, family events, educational settings, as well as religious communities.

**Estimation of the reproduction number (R)**

The presented case numbers do not fully reflect the temporal progression of incident COVID-19-cases, since the time intervals between actual onset of illness and diagnosis, reporting, as well as data transmission to the RKI vary greatly. Therefore, a nowcasting approach is applied to model the true temporal progression of COVID-19 cases according to illness onset. Figure 4 shows the result of this analysis.

The reproduction number, R, is defined as the mean number of people infected by one infected person. R can only be estimated based on statistical analyses such as nowcasting and not directly extracted from the notification system.

![Figure 4: Number of notified COVID-19 cases with known date of illness onset (dark blue), estimated date of illness onset for cases without reported date of onset (grey) and estimated number of not yet notified cases according to illness onset electronically reported to RKI (light blue) (as of 07/08/2020, 12 AM, taking into account cases up to 03/08/2020).](image)

A sensitive 4-day-R-value can be estimated by using a 4-day moving average of the number of new cases estimated by nowcasting. This 4-day value reflects the infection situation about one to two weeks ago. This value reacts sensitively to short-term changes in case numbers, such as those caused by individual outbreaks. Furthermore, outbreak dynamics may be influenced widespread testing performed among affected persons, leading to therapid detection of many additional COVID-19 cases. This can lead to relatively large fluctuations in the estimated R-value, especially if the total number of new cases is small.

Note: The report is a snapshot and is continuously updated.
The current estimate of the 4-day R-value is 1.16 (95%-prediction interval: 0.92 – 1.42) and is based on electronically notified cases as of 07/08/2020, 12:00 AM.

Similarly, the 7-day R-value is estimated by using a moving 7-day average of the nowcasting curve. This compensates for fluctuations more effectively, as this value represents a slightly later course of infection of about one to a little over two weeks ago. The 7-day R-value is estimated at 1.16 (95% prediction interval: 1.02 – 1.33) and is based on electronically notified cases as of 07/08/2020, 12:00 AM.

The reported R values has been around 1 or slightly above since mid-July 2020. This is due to a larger number of small outbreaks, but also case numbers in Germany overall, which have increased steadily in recent weeks since the relaxation of the measures.

See also the RKI’s statement on high case numbers of 24/07/2020 https://www.rki.de/DE/Content/InfAZ/N/Neuartiges_Coronavirus/Gestiegene_Fallzahlen.html

Sample calculations as well as an excel sheet presenting both R-values with daily updates can be found under www.rki.de/covid-19-nowcasting. A detailed methodological explanation of the more stable 7day R-value is also available there. More general information and sample calculations for both R-values can also be found in our FAQs (http://www.rki.de/covid-19-faq).

DIVI intensive care register

A registry of the German Interdisciplinary Association for Intensive and Emergency Medicine (DIVI), the RKI and the German Hospital Federation (DKG) was established to document intensive care capacity as well as the number of COVID-19 cases treated in participating hospitals (https://www.intensivregister.de/#/intensivregister). The DIVI intensive care register documents the number of available intensive care beds in the reporting hospitals on a daily basis. Since 16/04/2020, all hospitals with intensive care beds are required to report.

As of 05/08/2020, a total of 1,273 hospitals or departments reported to the DIVI registry. Overall, 30,422 intensive care beds were registered, of which 21,442 (70%) are occupied, and 8,980 (30%) are currently available. The number of COVID-19 cases treated in participating hospitals is shown in Table 4.

Table 4: COVID-19 patients requiring intensive care (ICU) recorded in the DIVI register (06/08/2020, 12:15 PM).

<table>

</tr>
</tbody>
</table>

*The interpretation of these numbers must take into account the number of reporting hospitals and therefore the number of reported patients may change from day to day. On certain days, this can explain an occasionally important decrease or increase in the cumulative number of discharged patients or deaths compared with the day before.

Note: The report is a snapshot and is continuously updated.
Mortality Monitoring

A total of 24 European countries provide the European EuroMOMO project (European monitoring of excess mortality for public health action) with official mortality statistics on a weekly basis which allows the detection and measuring of excess deaths related to e.g. seasonal influenza and pandemics (https://www.euromomo.eu/). In Germany, two regional systems that allow the transmission of data, have been established so far (since 2007 in Berlin and Hesse). The establishment of a nationwide monitoring system is planned from 2021 onwards.

An increase in all-cause mortality was observed in conjunction with the COVID-19 pandemic primarily in April 2020. Excess mortality was observed primarily in persons 65 years of age and older, but also among those 15 to 64-years of age. Excess mortality was highest in Belgium, France, Italy, the Netherlands, Spain, Sweden, Switzerland and the UK. All-cause mortality for the countries in the EuroMOMO network has now largely returned to expected levels.

Weekly mortality statistics are also recorded on the website of the Federal Statistical Office, albeit with a certain time lag. A special evaluation of excess mortality is normally updated weekly every two weeks.

Looking at the development by months, in March 2020 there was no noticeable increase in the number of deaths compared to March of the previous year. In April, however, all cause mortality was significantly above the average of previous years; but decreased to expected levels since the beginning of May.

Risk Assessment by the RKI

General assessment

At the global and the national level, the situation is very dynamic and must be taken seriously. The number of cases continues to increase worldwide. The number of newly reported cases declined from mid-March until early July. Since then, case numbers have been steadily increasing. Some districts are transmitting very few or no cases to the RKI. However, individual outbreaks are increasingly occurring again, which can reach considerable proportions. Vaccines and anti-viral therapeutics are currently not available. The RKI currently assesses the risk to the health of the German population overall as high and as very high for risk groups. This assessment may change at short notice based on new insights.

Infection risk

SARS-CoV-2 can be transmitted easily from person to person. The risk of infection depends heavily on the regional spread, living conditions and also on individual behaviour (physical distancing, hygiene measures and community masks).

Disease severity

In most cases, the disease is mild. The probability of progression towards serious disease increases with increasing age and underlying illnesses. Individual long-term consequences cannot be estimated yet.
Burden on health system

The burden on the health care system depends largely on the geographical distribution of cases, health care capacity and initiation of containment measures (isolation, quarantine, physical distancing etc.). In large parts of Germany it is currently low, but it can rapidly increase locally and affect the public health system in particular as well as medical care facilities.

Measures taken in Germany

- The ministry of health has published a record of all measures implemented in Germany since 27/01/2020
  https://www.bundesgesundheitsministerium.de/coronavirus/chronik-coronavirus.html (in German)
- Information from the Ministry of Health for travelers entering Germany: Frequently asked questions and answers (in German) https://www.bundesgesundheitsministerium.de/coronavirus-infos-reisende/faq-tests-einreisende.html
- Corona-Warn-App
  https://www.rki.de/DE/Content/InfAZ/N/Neuartiges_Coronavirus/WarnApp/Warn_App.html
- Regulations for persons entering Germany in connection with the novel coronavirus SARS-CoV-2 (15.06.2020) https://www.rki.de/DE/Content/InfAZ/N/Neuartiges_Coronavirus/Transport/BMG_Merkblatt_Reisende_Tab.html
- Information on additional regulations at the regional level regarding control measures such as physical distancing or quarantine regulations for persons entering from other countries can be accessed here: https://www.bundesregierung.de/breg-de/themen/coronavirus/corona-bundeslaender-1745198 (in German)
- (Non-medical) face masks must be worn on public transport and in shops in all federal states.
- Data on current disease activity can be found in the daily situation reports and on the RKI dashboard:
  https://corona.rki.de/
- A distance of 1.5 metres to other individuals must be maintained in public spaces:
