**Summary (as of 04/09/2020 12:00 AM)**

- Since calendar week 35 the 7-day-COVID-19 incidence has slightly decreased after a rise between calendar week 29 and 34. Although the number of new cases has started to decrease, the situation must still be carefully monitored.
- The cumulative nationwide incidence over the past 7 days was **8.6** cases per 100,000 inhabitants. A total of **19** districts transmitted zero cases over the past 7 days. In a further **159** districts the 7-day-incidence is below 5.0/100,000 inhabitants.
- In Baden-Wuerttemberg, Bavaria, Berlin, Bremen and Hamburg the 7-day incidence is considerably higher than the national mean 7-day-incidence.
- In total, **247,619** laboratory-confirmed COVID-19 cases and **9,322** deaths associated with COVID-19 have been electronically reported to the RKI in Germany.
- Moreover, further COVID-19-related outbreaks are being reported in various settings, including nursing homes and hospitals, facilities for asylum-seekers and refugees, educational settings, various occupational settings, in the context of religious or family events and especially among travellers.
Epidemiological Situation in Germany

In accordance with the international standards of the WHO\(^1\), the RKI evaluates all laboratory diagnostic evidence of SARS-CoV-2 as COVID-19 cases, regardless of the presence or severity of the clinical symptoms. In the following report, “COVID-19 cases” thus includes both acute SARS-CoV-2 infections and COVID-19 diseases.

**General current assessment**

The increase in the number of cases reported since mid-July has stabilized in the last week and the 7-day incidence has fallen again nationwide. The R-value is currently below 1. It is noticeable that in the last few weeks more young people have become infected, thus the 7-day incidence is significantly higher in younger age groups than in older age groups.

There are outbreaks in various districts throughout Germany, which are associated with different situations, e.g. larger celebrations in the family and among friends. In addition, COVID-19 cases are identified to a large extent among travel returnees, especially in the younger age groups.

The current development is positive, but must be further carefully monitored. The current decline in the proportion of deaths among the reported cases is mainly explained by the relatively high proportion of younger people among the newly diagnosed cases, of which relatively few fall seriously ill and die. A renewed increase in new infections must nevertheless be avoided. In particular, it is important to prevent a renewed increase among the elderly and particularly among vulnerable groups of the population, as was the case at the beginning of the pandemic. If more elderly people become infected again, a renewed increase in hospitalizations and deaths must be expected.

It is therefore still necessary for the entire population to be committed to infection control, e.g. by consistently observing rules of distance and hygiene - also outdoors -, by ventilating indoor spaces and, where necessary, by wearing a mouth-nose cover correctly. Crowds of people - especially indoors - should be avoided if possible and celebrations should be limited to the closest circle of family and friends.

**Geographical distribution of cases**

Epidemiological analyses are based on validated cases notified electronically to the RKI in line with the Protection Against Infection Law (Data closure: 12:00 AM daily). Since January 2020, a total of 247,619 (+1,453) laboratory-confirmed cases of COVID-19 have been electronically reported to and validated by the RKI (see Figure 1 and Table 1). A total of 19 districts reported no cases in the past 7 days; however on 16/06/2020 the number of districts reporting zero cases still amounted to 139 districts.

*Note: The report is a snapshot and is continuously updated*
Figure 1: Number and cumulative incidence (per 100,000 population) of the 247,619 electronically reported COVID-19 cases in Germany by county and federal state (04/09/2020, 12:00 AM). Please see the COVID-19 dashboard (https://corona.rki.de/) for information on number of COVID-19 cases by district (local health authority).

Table 1: Number and cumulative incidence (per 100,000 population) of laboratory-confirmed COVID-19 cases and deaths for each federal state electronically reported to RKI, Germany (04/09/2020, 12:00 AM). The number of new cases covers positive cases, which have been sent to the local health department at the same day, but also at previous days.

Quality checks and data cleaning by the health authorities and regional offices can lead to corrections to cases previously transmitted (e.g. detection of duplicate reports). This can occasionally lead to negative values for the number of new cases.

Note: The report is a snapshot and is continuously updated.
Distribution of cases over time

The first COVID-19 cases in Germany were notified in January 2020. Figure 2 shows COVID-19 cases transmitted to RKI according to date of illness onset from 01/03/2020 onwards. Of these cases, the onset of symptoms is unknown for 86,798 cases (35%), thus their date of reporting is provided.

![Figure 2: Number of COVID-19 cases in Germany electronically reported to the RKI by the date of symptoms onset or –if unknown- alternatively by date of reporting since 01/03/2020 (04/09/2020, 12:00 AM).]

Clinical aspects

Information on symptoms is available for 205,288 (83%) of the notified cases. Commonly reported symptoms were cough (45%), fever (38%), rhinorrhoea (20%) and sore throat (19%). Pneumonia was reported in 5,492 cases (3%). Since calendar week 17, cases are reported to the RKI as a distinct COVID-19 surveillance category. Since then, ageusia and anosmia can also be entered as symptoms. At least one of these two symptoms was reported in 9,468 of 60,807 cases (16%).

Hospitalisation was reported for 32,611 (15%) of 213,631 COVID-19 cases with information on hospitalisation status.

Approximately 221,900 people have recovered from their COVID-19 infection. Since the exact date of recovery is unknown in most cases, an algorithm was developed to estimate this number.

A total of 9,322 COVID-19-related deaths have been reported in Germany (3.8% of all confirmed cases). Of these, 5,168 (55%) are men and 4,150 (45%) are women, the gender is unknown in four cases. The mean age of COVID-19 cases reported to have died was 81 years (median: 82 years). Of all deaths, 7,956 (85%) were in people aged 70 years or older, but only 15% of all cases were in this age group.

Occupation, accommodation or care in facilities

In accordance with the Protection Against Infection Act (Infektionsschutzgesetz, IfSG), the RKI receives information on occupation, accommodation or care in a facility relevant for infection control for reported COVID-19 cases. Since information on occupation, accommodation or care in these facilities is missing in 25% of cases; the proportion of cases working, accommodated or cared for in these facilities reported here should be considered minimum values. Among the COVID-19 cases reported from the above mentioned facilities, the proportion of cases that actually acquired their infection in these facilities is unknown.

Note: The report is a snapshot and is continuously updated
The number of COVID-19 cases was highest among persons cared for or employed in care facilities according to §36 IfSG and among persons employed in medical facilities according to §23 IfSG (Table 2). The number of deaths was particularly high among persons cared for in these facilities.

Among the cases reported as working in medical facilities (§23 IfSG), 73% were female and 27% male. Their median age was 41 years. The high number of cases among people cared for or working in various care facilities (§36 IfSG) is consistent with numerous reported outbreaks, especially in nursing homes. The high number of cases among persons working in the food sector (§42 IfSG) is largely due to outbreaks in meat processing plants.

Table 2: Notified COVID-19-cases according to possible occupation, accommodation or care in facilities relevant for transmission of infectious diseases according to the Protection Against Infection Act (IfSG), reported to RKI (246,057* cases, no data available for 62,414 cases; 04/09/2020, 12:00 AM)

*for care according to § 33 IfSG only cases under 18 years of age are taken into account, as other information may be assumed to be incorrect.

Outbreaks

In 9 districts an increased incidence of ≥25 cases in 7 days/100,000 inhabitants was reported. Affected are mainly districts in the federal state of Bavaria. The increased incidence in the affected districts is mainly due to people returning home from vacations abroad, but also to transmission in family and other private events.

In the district Trier-Saarburg, an outbreak occurred in a facility for asylum seekers. All residents of the facility are under quarantine.

Further COVID-19-related outbreaks continue to be reported in nursing homes, hospitals, facilities for asylum seekers and refugees, community facilities, various occupational settings and in connection with religious events.
Estimation of the reproduction number (R)

The presented case numbers do not fully reflect the temporal progression of incident COVID-19-cases, since the time intervals between actual onset of illness and diagnosis, reporting, as well as data transmission to the RKI varies greatly. Therefore, a nowcasting approach is applied to model the true temporal progression of COVID-19 cases according to illness onset. Figure 3 shows the result of this analysis.

The reproduction number, R, is defined as the mean number of people infected by one infected person. R can only be estimated based on statistical analyses such as nowcasting and not directly extracted from the notification system.

Figure 3: Number of notified COVID-19 cases with known date of illness onset (dark blue), estimated date of illness onset for cases without reported date of onset (grey) and estimated number of not yet notified cases according to illness onset electronically reported to RKI (light blue) (as of 04/09/2020, 12 AM, taking into account cases up to 31/08/2020).

A sensitive 4-day-R-value can be estimated by using a 4-day moving average of the number of new cases estimated by nowcasting. This 4-day value reflects the infection situation about one to two weeks ago. This value reacts sensitively to short-term changes in case numbers, such as those caused by individual outbreaks. Furthermore, outbreak dynamics may be influenced widespread testing performed among affected persons, leading to the rapid detection of many additional COVID-19 cases. This can lead to relatively large fluctuations in the estimated R-value, especially if the total number of new cases is small.

The current estimate of the 4-day R-value is 0.85 (95%-prediction interval: 0.67 – 1.04) and is based on electronically notified cases as of 04/09/2020, 12:00 AM.

Similarly, the 7-day R-value is estimated by using a moving 7-day average of the nowcasting curve. This compensates for fluctuations more effectively, as this value represents a slightly later course of infection of about one to a little over two weeks ago. The 7-day R-value is estimated at 0.94 (95% prediction interval: 0.84 – 1.06) and is based on electronically notified cases as of 04/09/2020, 12:00 AM.

The reported R values have been above 1 since mid-July 2020. Since the beginning of the past week they are around 1 or below 1. The increased R-values can be attributed in large part to increasing cases among travellers, particularly returning after trips during the summer vacations, but also to a still existing larger number of smaller outbreaks. The current R-values reflect the stabilization of the country wide case numbers during the past days.

Note: The report is a snapshot and is continuously updated.
See also the RKI’s statement on high case numbers of 24/07/2020
https://www.rki.de/DE/Content/InfAZ/N/Neuartiges_Coronavirus/Gestiegene_Fallzahlen.html

Sample calculations as well as an excel sheet presenting both R-values with daily updates can be found under www.rki.de/covid-19-nowcasting. A detailed methodological explanation of the more stable 7day R-value is also available there. More general information and sample calculations for both R-values can also be found in our FAQs (http://www.rki.de/covid-19-faq).

A detailed description of the methodology is available at

**DIVI intensive care register**

The German Interdisciplinary Association for Intensive and Emergency Medicine (DIVI) has in collaboration with RKI established a registry to document the number of available intensive care beds as well as the number of COVID-19 cases treated in participating hospitals on a daily basis. Since 16/04/2020, all hospitals with intensive care beds are required to report.

(https://www.intensivregister.de/#/intensivregister)

As of 04/09/2020, a total of 1,286 hospitals or departments reported to the DIVI registry. Overall, 30,721 intensive care beds were registered, of which 21,760 (71%) are occupied, and 8,961 (28%) are currently available. The number of COVID-19 cases treated in participating hospitals is shown in Table 3.

Table 3: COVID-19 patients requiring intensive care (ICU) recorded in the DIVI register (04/09/2020, 12:15 PM).

<table>
<thead>
<tr>
<th></th>
<th>Number of patients</th>

<td></td>
<td>30</td>
</tr>
<tr>
<td>- of these: deaths</td>
<td>4,049</td>
<td>24%</td>
<td>-1</td>
</tr>
</tbody>
</table>

*The interpretation of these numbers must take into account the number of reporting hospitals and therefore the number of reported patients may change from day to day. On certain days, this can explain an occasionally important decrease or increase in the cumulative number of discharged patients or deaths compared with the day before.

**Mortality Monitoring**

A total of 24 European countries provide the European EuroMOMO project (European monitoring of excess mortality for public health action) with official mortality statistics on a weekly basis which allows the detection and measuring of excess deaths related to e.g. seasonal influenza and pandemics (https://www.euromomo.eu/). In Germany, two regional systems that allow the transmission of data have been established so far (since 2007 in Berlin and Hesse). The establishment of a nationwide monitoring system is planned from 2021 onwards.

An increase in all-cause mortality was observed in conjunction with the COVID-19 pandemic primarily in April 2020. Excess mortality was observed primarily in persons 65 years of age and older, but also among those 15 to 64-years of age. Excess mortality was highest in Belgium, France, Italy, the Netherlands, Spain, Sweden, Switzerland and the UK. All-cause mortality for the countries in the EuroMOMO network has now largely returned to expected levels.

Weekly mortality statistics are also recorded on the website of the Federal Statistical Office, albeit with a certain time lag. A special evaluation of excess mortality is normally updated weekly every two weeks.

*Note: The report is a snapshot and is continuously updated*
Looking at the development by months, in March 2020 there was no noticeable increase in the number of deaths compared to March of the previous year. In April, however, all-cause mortality was significantly above the average of previous years; but decreased to expected levels since the beginning of May. In calendar week 32, 2020 (03/08 – 09/08) 16,975 people died (-140 compared to week 31).

Risk Assessment by the RKI

General assessment

At the global and the national level, the situation is dynamic and must be taken seriously. This is a dynamic and serious situation worldwide and in Germany. The number of cases continues to increase worldwide. The number of newly reported cases in Germany declined from about mid-March to the beginning of July, since then the number of cases has increased but has stabilized over the past week. Large and small outbreaks continue to occur throughout Germany, particularly in connection with celebrations with family and friends and at group events. Travel returnees, especially in the younger age groups, have also contributed to the increase in case numbers in July and August. There are still no approved vaccines and the treatment of severe disease courses is complex and lengthy.

The Robert Koch Institute still estimates the risk to the health of the German population to be high, and very high for risk groups. This assessment may change in the short term due to new findings.

Infection risk

SARS-CoV-2 can be transmitted easily from person to person. The risk of infection depends heavily on the regional spread, living conditions and also on individual behaviour (physical distancing, hygiene measures and community masks). Here, contacts in risk situations (such as long face-to-face contact) play a special role. Aerosol emission increases sharply when speaking loudly, singing or laughing. In indoor rooms, this significantly increases the risk of transmission, even if a distance of more than 1.5 m is maintained. If the minimum distance of 1.5 m without covering the mouth and nose is not maintained, e.g. when groups of people sit at a table or in large gatherings, there is also an increased risk of transmission outdoors.

Disease severity

In most cases, the disease is mild. The probability of progression towards serious disease increases with increasing age and underlying illnesses. Individual long-term consequences cannot be estimated yet. The individual risk cannot be derived from epidemiological/statistical data. Thus, even without known previous illnesses and in young people, the course of the disease can be severe or even life-threatening. Long-term consequences, even after slight progressions, cannot yet be assessed.

Burden on health system

The burden on the health care system depends largely on the geographical distribution of cases, the main population groups affected, the health care capacity and initiation of containment measures (isolation, quarantine, physical distancing etc.). In large parts of Germany it is currently low, but it can rapidly increase locally and affect the public health system in particular as well as medical care facilities.
