Figure 3: Flow chart of literature search for intussusception risk due to Rotavirus vaccines (Rotarix®, RotaTeq®)

Appendix II: Characteristics of included efficacy studies

Study	Vesikari-2007-RX [104]		
Vaccine	Rotarix		
Objectives	To evaluate the efficacy, immunogenicity and safety of 2 doses of RV-vaccine in		
	healthy infants when co-administered with specific childhood vaccinations in the		
	European setting. The immunogenicity of childhood vaccinations was also evaluated		
	to explore any effect of co-administration with the RV-vaccine.		
Study period	September 2004 - August 2006		
Study site	6 European countries; Finland (74%), France (4%), Germany (7%), Czech Republic		
	(7%), Spain (8%), Italy (1%)		
Methods	Randomized controlled trial (2:1); Length of follow-up: 2 years		
	Efficacy analysis was undertaken for 3 periods: 1 st : from 2 weeks post-dose two up		
	to the end of the first rotavirus epidemic season 2 nd : from the end of the 1st rotavirus		
	epidemic season to the end of the 2 nd epidemic season; 3 rd : the combined period.		
	Data analysis was planned for the total vaccinated cohort (TVC) from the 1 st dose		
	onwards for all participants who received at least 1 dose.		
Participants	Number: 3,994 randomised; 3,848 completed		
	Vaccine group: 2,646 randomised; 2,554 completed		
	Control group: 1,348 randomised; 1,294 completed		
	Inclusion: healthy infants aged 6 – 14 weeks who weighed >2000 g at birth		
	Exclusion: acute disease at the time of enrolment, a history of chronic		
	administration of immunosuppressants since birth, received any vaccines or		
	treatments prohibited by the protocol, or had any disorders or illnesses excluded by		
	the protocol.		
Intervention	1. Rotarix (RIX4414) vaccine contained 10 ^{6.5} PFU; 2 doses given 1 or 2 months		
	apart		
	2. Placebo: same constituents as vaccine but without virus; 2 doses given 1 or 2		
	months apart		
	1 st vaccine dose given at 6 - 12 weeks of age; vaccination was postponed if		
	temperature ≥ 37.5 (ax) or ≥ 38 (rectal) or gastroenteritis (GE) within 7 days before		
	planned vaccination. Except OPV other routine childhood vaccines could be		
	administered concomitantly.		
Outcomes	Efficacy:		
	Primary outcome: RVGE caused by wild-type RV of any severity during the first		
	follow-up period		
	Secondary outcomes measured in different time periods:		
	- any and severe RVGE (Vesikari-severity score ≥11) caused by wild-type RV		
	- any RVGE requiring medical attention (medical provider contact, advice, visit)		
	- hospitalization admission due to RVGE caused by wild-type RV		

	Vesikari-severity score used for assessment of severity			
	Safety:			
	Serious adverse events (SAE) (intussusception) recorded throughout the whole			
	study period.			
	Reactogenicity: (Day 0	Reactogenicity: (Day 0-7) Diarrhoea, Fever, Vomiting		
Funding	GlaxoSmithKline Biolog	gicals		
Risk of bias	Assessment	Description		
Adequate	adequate	GSK Biologicals provided vaccine supplies that were		
sequence		numbered with a computer-generated randomisation list		
generation				
Allocation	adequate	Randomisation was done by a central internet		
concealment		randomisation system. Infants were randomly allocated in a		
		2:1 ratio two doses of either RIX4414 or placebo.		
Blinding	adequate	Treatment allocation remained concealed from investigators		
		and the parents of participating infants throughout the study.		
Missing	no	Missing data adequately presented		
output data				
Selective	no	Data are provided for all RVGE outcomes and for all cause		
reporting		GE (severe and with hospitalisation)		
Other bias	unclear	No information		
Comments	Information about distribution and kind of included study centres missing			
	(generalizability/ representativeness); no information on method of enrolment,			
	number of eligible infants missing (possible confounding: e.g. socio economic			
	differences, siblings). No placebo-intervention arm without irrigating ingredients			
	(glucose). Evaluation of surveillance regarding gastroenteritis episodes not			
	presented (e.g., number of not successful parent contacts, missing stool samples).			
	Efficacy analysis was almost exclusively presented per protocol; analysis of total			
	vaccinated cohort (TVC) for RVGE of any severity (1 st + 2 nd year) and for severe			
	RVGE (1 st + 2 nd year).

	rotavirus gastroenteritis during the first 2 years of life in European infants:			
	randomised, double-bli	nd controlled study." Lancet 370(9601): 1757-1763.		

Study	Ruiz-Palacios-2006-RX [100, 107]
Vaccine	Rotarix
Objectives	To evaluate the safety, immunogenicity and efficacy of Rotarix in healthy infants
	approximately 2-3 months of age at the time of the first dose.
Study period	August 2003 - October 2005
Study site	Multicentre study conducted at multiple sites in 10 countries in Latin America
	(Argentina, Brazil, Chile, Colombia, Dominican Republic, Honduras, Mexico,
	Nicaragua, Panama and Venezuela) and Finland.
	Follow up in the 2 nd year after vaccination only in Latin America
Methods	Randomized, placebo-controlled trial (1:1), multi-country and multi-centre study;
	Length of follow up:
	For efficacy: from 2 weeks post dose 2 until 2 years of age
	For safety: from dose 1 till the end of the study.
Participants	Number: 63,225 randomised for safety; 59,308 completed for safety; from the
	safety cohort 20,169 randomised for efficacy; 17,882 completed 1 st year efficacy
	and 14,615 2 nd year efficacy
	Vaccine group safety: 31,673 randomised; 29,616completed
	Control group safety: 31,552 randomised; 29,465completed
	Vaccine group efficacy: 10,159 randomised; 9,009completed
	Control group efficacy: 10,010 randomised; 8,858 completed
	Inclusion criteria:
	Healthy infants 6 - 13 weeks old at dose 1 with written informed consent.
	Exclusion criteria:
	Allergic reaction to vaccine components; clinically significant history of chronic GI
	disease or GI malformation or other serious medical condition or received vaccines
	or treatment prohibited by the protocol; or immunocompromised condition.; use of
	any investigational or non-registered drug or vaccine other than the study vaccine
	within 30 days preceding the 1 st dose of study vaccine, or planned use during the
	study period; acute disease at time of enrolment; gastroenteritis within 7 days
	preceding the study vaccine administration; previous confirmed occurrence of
	RVGE; HIV moderately and severely symptomatic: stages III and IV.
Intervention	1. Rotarix (RIX4414) vaccine contained 10 ^{6.5} PFU; 2 doses given 4 to 8 weeks
	apart
	2. Placebo: same constituents as vaccine but without virus; 2 doses given 4 to 8
	weeks apart
	1 st vaccine dose given at 6 - 13 weeks of age. Except OPV other routine childhood
	vaccines could be administered concomitantly.
Outcomes	- Severe Adverse Events (SAE) (e.g., confirmed intussusception)
	- Severe all-cause diarrhoea
	- All-cause diarrhoea; from 2 weeks after 2 nd dose up to 2 years' follow-up
	- All-cause diarrhoea; from 2 weeks after 2 nd dose up to 2 years' follow-up

	- RVGE; from 2 weeks after 2 nd dose up to 2 years' follow up		
	- Severe RVGE; from 2 weeks after 2 nd dose up to 2 years' follow-up		
	- RVGE requiring hospitalization		
	- Reactogenicity; up to 30 days after vaccination		
Funding	GlaxoSmithKline Biol	ogicals	
Risk of bias	Assessment	Description	
Adequate	adequate	GSK provided vaccine supplies that were numbered with a	
sequence		computer-generated randomisation list; a blocking scheme	
generation		randomisation was used. GSK did the masking and	
		concealment.	
Allocation	adequate	Randomisation was done by a central internet	
concealment		randomisation system.	
Blinding	adequate	Treatment allocation remained concealed from investigators	
		and parents of participating infants throughout the study.	
		GSK did the masking and concealment.	
Missing output	unclear	Insufficient description of attrition in the 2 nd year follow up.	
data			
Selective	yes	Not all prespecified outcomes reported (data about RVGE of	
reporting		any severity is missing).	
Other bias	unclear	No information.	
Comments	Information about dis	tribution and kind of included study centres missing	
	(generalizability /repr	esentativeness); no information on method of enrolment,	
	number of eligible infa	ants missing (possible confounding: e.g., socio economic	
	differences, siblings).	No placebo-intervention arm without irrigating ingredients	
	(glucose). Evaluation	of surveillance regarding gastroenteritis episodes not	
	presented (e.g., num	ber of not successful parent contacts, missing stool samples).	
	Efficacy analysis was	almost exclusively presented per protocol (except severe	
	RVGE1 st year).		
References:	Ruiz-Palacios, G. M.	, I. Perez-Schael, et al. (2006). "Safety and efficacy of an	
	attenuated vaccine a	gainst severe rotavirus gastroenteritis." New England Journal	
	of Medicine 354(1): 1	1-22. (Data about 1 st year)	
	Linhares, A. C., F. R. Velázquez, et al. (2008). "Efficacy and safety of an oral live		
	attenuated human rotavirus vaccine against rotavirus gastroenteritis during the first		
	2 years of life in Latin American infants: a randomised, double-blind, placebo-		
	controlled phase III s	tudy." The Lancet 371(9619): 1181-1189. (2 nd year)	

Study	Phua-2009-RX [103]		
Vaccine	Rotarix		
Objectives	Aim to assess efficacy of Rotarix against severe RVGE during the 1 st 2 years of life		
	in high-income countries of Southeast and East Asia (Focus on VE assessment		
	against the G2 type).		
Study period	December 2003-July 2007		
Study site	21 study centres in 3 Asian countries (Hong Kong, Singapore, Taiwan)		
Methods	Randomized, placebo-controlled trial, multi-country and multi-centre study; (1:1)		
	Length of follow up: 2 weeks post dose 2; up to 2 years		
Participants	Number : (Hong Kong (n=3,025), Singapore (n=6,542), Taiwan (n=1,141))		
	Total cohort: 10,708 randomised; 10,519 completed 2 nd year		
	Vaccine group: 5,359 randomised; 5,263 completed 2 nd year		
	Control group: 5,349 randomised; 5,256 completed 2 nd year		
	Inclusion: healthy infants 6 - 12 weeks old in Hong Kong and Taiwan, or 11-17		
	weeks old in Singapore.		
	Exclusion: chronic administration of immunosuppressants since birth, confirmed		
	or suspected immunosuppressive or immunodeficient condition, history of allergic		
	disease, any investigational drugs/vaccines from 30 days before Dose 1 or		
	planned use during the study, received immunoglobulins and/or blood products		
	since birth or planned administration during the study, any clinically significant		
	history of chronic gastrointestinal disease including any malformation of		
	gastrointestinal tract or other serious medical condition.		
Intervention	1. Rotarix (RIX4414) vaccine contained 10 6.0 PFU; 2 doses given 1-2 months		
	apart		
	2. Placebo: same constituents as vaccine but without virus; 2 doses given 1-2		
	months apart		
	Vaccination was postponed if temperature ≥ 37.5 (ax) or ≥ 38 (rectal) or GE within		
	7 days before planned vaccination. If oral polio vaccine is administered as part of		
	routine schedule, a time interval of 2 weeks should be provided. 1st vaccine dose		
	given at 6 - 11 weeks of age in Singapore and Hong Kong, 11 - 17 weeks in		
	Taiwan. Except OPV other routine childhood vaccines could be administered		
	concomitantly.		
Outcomes	- all-cause diarrhoea:		
	- severe all-cause diarrhoea (Vesikari-severity score ≥11)		
	- RVGE with wild type RV		
	- Severe rotavirus diarrhoea: see above (Vesikari-severity score ≥ 11)		
	- Emergency department visits for capture GE episodes requiring hospitalisation		
	- SAE; Intussusception and any other serious adverse events		
Funding	GlaxoSmithKline Biologicals		

Risk of bias	Assessment Description		
Adequate	adequate	A randomisation list was generated at GSK Biologicals,	
sequence		Rixensart, using a standard SAS® program and was used to	
generation		number the vaccines.	
Allocation	adequate	A randomisation blocking scheme was used to ensure that	
concealment		the balance between treatments was maintained. Treatment	
		allocation at the investigator sites was performed using a	
		central randomisation system on the internet.	
Blinding	adequate	Study investigators, study personnel and parents/guardians	
		of the infants were blinded throughout the study.	
Missing output	no	Missing data reported adequately.	
data			
Selective	unclear	VE for total vaccinated cohort only presented for severe	
reporting		RVGE of 2-year period.	
Other bias	unclear	No information.	
Comments	Information about distribution and kind of included study centres missing		
	(representativeness); no information on method of enrolment, number of eligible		
	infants missing (possible confounding: e.g., socio economic differences, siblings).		
	Reasons for attendance of participants at study centres (hospitals) unknown		
	(representativeness questionable). No placebo-intervention arm without irrigating		
	ingredients (glucose). Virus concentration in vaccine different (10 ^{6.0} vs. 10 ^{6.5}) to		
	that approved for use in Germany. Efficacy analysis was almost exclusively		
	presented per protoc	ol.	
References:	Phua, K. B., F. S. Lir	n, et al. (2009). "Safety and efficacy of human rotavirus	
	vaccine during the first 2 years of life in Asian infants: Randomised, double-blind,		
	controlled study." Vac	ccine 27(43): 5936-5941.	

Study	Kawamura-2011-RX [102]
Vaccine	Rotarix
Objectives	Aim of the study was to assess the efficacy, immunogenicity and safety of RIX4414
	when administered to healthy Japanese infants 6-14 weeks of age.
Study period	June 2007 - November 2009
Study site	Japan (20 centers)
Methods	Randomized controlled trial (2:1);
	Length of follow-up:
	For efficacy: from 2 weeks post dose 2 until 2 years of age
	For safety: 8-day follow-up post vaccination for solicited symptoms; 31-day follow-
	up post-vaccination for unsolicited adverse events (AE), for serious AE (SAE) follow-
	up till the end of the study.
	Efficacy: ATP-analysis
	Safety. TVC-analysis
Participants	Number: 765 randomised; 748 (813) completed
	Vaccine group: 508 (540) randomised; 498 completed
	Control group: 257 (273) randomised; 250 completed
	Inclusion: healthy infants aged 6-14 weeks at the time of the first vaccination and
	born in time (36-42 week of gestation)
	Exclusion: received any investigational drug or vaccine 30 days preceding 1 st dose,
	received other RV vaccine, were administered immunosuppressive drugs, had
	history of chronic gastrointestinal disease or gastrointestinal malformation,
	suspected immunosuppression or immunodeficiency, had GE 7 days preceding 1 st
	dose.
Intervention	1. Rotarix (RIX4414) vaccine contained 10 ^{6.0} PFU; 2 doses given 1 month apart
	2. Placebo: same constituents as vaccine but without virus; 2 doses given 1 month
	apart.
	1 st vaccine dose given at 6-14 weeks of age. Except OPV other routine childhood
	vaccines could be administered concomitantly.
Outcomes	Efficacy:
	Primary outcome: RVGE of any severity caused by wild-type RV leading to medical
	intervention,
	Secondary outcome:
	- severe RVGE caused by wild-type RV leading to medical intervention (Vesikari-
	severity score ≥11)
	- any RVGE caused by wild-type RV leading to medical intervention
	- hospitalisation due to RVGE caused by wild-type RV leading to medical
	intervention
	Vesikari-severity score used for assessment of severity
	Safety: solicited AEs (fever, diarrhoea, vomiting) were recorded from Day 0 to Day 7

	SAEs (Intussusception) were recorded throughout the study period						
Funding	GlaxoSmithKline Biologicals						
Risk of bias	Assessment	Description					
Adequate	adequate	SAS program was used to generate a randomization list (2:1					
sequence		ratio) to number the vaccines and placebo packages.					
generation

	6341.						

Study	Block-2007-RQ [105						
Vaccine	RotaTeq						
Objectives	Evaluation of efficacy	of RotaTeq at the end of shelf life in preventing RV-GE due					
	to wild-type G1-G4, in	n regard to its safety and immunogenicity in healthy infants.					
Study period	September 2002 - Ju						
Study site	27 study sites in the	U.S. and 3 in Finland					
Methods	Randomized, double-	-blind, placebo-controlled (vaccine/placebo = 1:1).					
	Length of follow up: 1	follow up: 1 RV season.					
	Active surveillance: p	eillance: parents contacted every 2 weeks in RV season.					
	Efficacy: evaluation of	of VE against different clinical outcomes in ATP cohort (GE					
	occurring 14 days aft	er 3 rd dose) and for one outcome in TVC (GE occurring after					
	1 st dose) (= MITT and	alysis).					
	Safety_assessment in	TVC. Immunogenicity in ATP-subgroup (n=150).					
Participants	Number: Sample siz	e calculation: 1400; 1312 enrolled and randomised.					
	Vaccine group: 650 T	VC; 551 completed in ATP cohort					
	Control group: 660 T	VC; 564 completed in ATP cohort					
	Inclusion: healthy in	fants between 6-12 weeks of age with informed consent from					
	parents or guardian.	Except OPV other licensed vaccines could be administered					
	concomitantly. No res	striction for feeding.					
	Exclusion: if infant h	ad received OPV 42 days before planned 1 st dose					
	vaccine/placebo or O	PV would be administered during the study.					
Intervention	Vaccine: RotaTeq (W	/C3) containing 1.1 x 10 ⁷ infectious units per dose. 1 st dose					
	given at 6-12 weeks	of age, following 2 doses each with 4-10 weeks apart.					
	Placebo: identical to	vaccine but did not contain RV reassortant or trace trypsin;					
	vaccination schedule	see above.					
Outcomes	Primary outcome (AT	P-cohort): RV-GE due to G1-G4-serotypes of any severity					
	occurring 14 days or	later after 3 rd dose.					
	Secondary outcomes	: RV-GE due to G1-G4 with moderate-and-severe and					
	exclusively severe dis	sease (ATP); all GE with a positive RV-ELISA (ATP); RV-GE					
	due to G1-G4 of any	severity occurring in TVC (MITT).					
	Safety (TVC): 7-day ı	monitoring after any dose on vaccine reactions, 42-day					
	monitoring on AE/SA	E.					
	Immunogenicity (n=1	50; ATP-subgroup): anti-RV IgA prior 1 st dose and 42 d after					
	3 rd dose.						
Funding	Merck & Co., Inc.						
Risk of bias	Assessment	Description					
Adequate	adequate	Enrolled infants were randomly assigned 1:1 by using					
sequence		computer-generated allocation schedules to receive either					
generation		vaccine or placebo.					
Allocation	adequate	Sequential identical containers; vaccine visibly					
L	I .						

concealment		indistinguishable from placebo.				
Blinding	adequate	Blinding was maintained throughout the study for study				
		investigators, study personnel, parents.				
Missing output	no	Missing data reported adequately				
data						
Selective	unclear	VE analysis is initially limited on efficacy against serotypes				
reporting		G1-G4: only VE against GE of any severity with positive RV-				
		ELISA is reported but not against severe GE.				
Other bias	unclear	No information				
Comments	Information about dis	tribution and kind of included study centres missing				
	(generalizability /repr	esentativeness); no information on method of enrolment,				
	number of eligible inf	ants missing (possible confounding: e.g., socio economic				
	differences, siblings).	No placebo-intervention arm without irrigating ingredients				
	(glucose). Evaluation	of surveillance regarding gastroenteritis episodes not				
	presented (e.g., num	ber of not successfully contacted parents, missing stool				
	samples). Efficacy ar	nalysis was almost exclusively presented per protocol (ATP)				
	and restricted on sero	otypes G1-G4.

	pentavalent human-b	ovine (WC3) reassortant rotavirus vaccine at the end of shelf				
	life. Pediatrics 2007;	119: 11-18.				

Study	Vesikari-2006-RQ [101]
Vaccine	RotaTeq
Objectives	Evaluation of safety with regard to intussusception and other AE and of efficacy of
	RotaTeq in preventing RV-GE due to wild-type G1-G4 and associated use of health
	care resources.
Study period	January 2001 – May 2005
Study site	Study centres in 11 countries: Belgium (infants enrolled n=1791), Costa Rica (1641),
	Finland (23422), Germany (4650), Guatemala (350), Italy (48), Jamaica (1805),
	Mexico (1121), Puerto Rico (640), Sweden (624), Taiwan (189), United States
	(33556).
Methods	Randomized, double-blind, placebo-controlled trial (1:1 ratio). Length of follow up: at
	least 1 RV season up to 3 RV seasons (substudy: "Finnish Extension Study (FES)").
	Active surveillance: parents were contacted on days 7, 14, 42 and every 6 weeks
	thereafter for at least 1 year. In "clinical efficacy substudy" they were contacted every
	2 weeks for at least 1 RV season. In 3 rd RV season (FES) parents were contacted
	every 12 weeks.
	Safety evaluation in TVC (68,038): primary safety hypothesis: no significantly higher
	risk of IS among vaccine than placebo recipients during 7-day or 42-day monitoring
	after each dose: based on RR and 95%CI: upper bound not >10.
	Detailed safety substudy (TVC subgroup, n=9605): detailed data on AE/SAE within
	7-day (fever, vomiting etc.) and 42-day monitoring.
	Clinical efficacy substudy (ATP subgroup; n=5673): VE against RV-GE (G1-G4)14 d
	after dose 3 up to 2 RV seasons (only infants from Finland and the U.S.).
	MITT in TVC (66,178): VE against RV-GE G1-G4 of any severity and in respect to
	hospitalisation and ED visits.
	Healthcare analysis (ATP) (57,134): follow-up up to 2 RV seasons in respect to
	hospitalisation and ED visits.
	FES (20,732): VE in 3 rd RV season in ATP and TVC.
	Immunogenicity in ATP-subgroup (350).
Participants	Number: Sample size calculation: 60,000; safety monitoring board decided to enrol
	additional 10,000 subjects. Totally enrolled 70,301; of them, 69,274 randomized; of
	them, 68,038 vaccinated.
	Vaccine group: 34,035 TVC; 28,646 completed in ATP cohort
	Control group: 34,003 TVC; 28,488 completed in ATP cohort
	Inclusion: healthy infants between 6-12 weeks of age with informed consent from
	parents or guardian. Except OPV other licensed vaccines could be administered
	concomitant. Breastfeeding was not restricted.
	Exclusion: if infant had received OPV 42 days before planned 1 st dose
	vaccine/placebo or OPV would be administered during the study.
Intervention	Vaccine: RotaTeq (WC3) containing app. 6.7 x 10 ⁷ to 12.4 x 10 ⁷ infectious units per

	dose: 1 st dose given at	6-12 weeks of age, following 2 doses each with 4-10 weeks				
		indistinguishable placebo (not more detailed reported);				
	vaccination schedule s					
Outcomes						
Outcomes		(including IS) for 42 days after each dose and for vaccine-				
		study (at least 1 RV season); "Detailed safety substudy"				
		E within 7-day (fever, vomiting etc.) and 42-day monitoring.				
	1	dy (ATP): VE against RV-GE (G1-G4) of any severity 14 d				
	after dose 3 for 1 year (primary efficacy). Secondary: VE against severe RV-GE G1-					
	G4 and VE in 2 nd seaso					
	, ,	TP): follow-up up to 2 RV seasons in respect to hosp and ED.				
	FES: VE in 3 rd RV seas	son in respect to hosp and ED (ATP & TVC).				
	MITT (TVC): VE agains	st RV-GE G1-G4 of any severity and in respect to hosp/ED				
	and medical attention.					
	Immunogenicity: anti-R	V IgA prior 1 st dose and 14 d after 3 rd dose.				
Funding	Merck & Co., Inc.					
Risk of bias	Assessment	Description				
Adequate	unclear	It can be assumed that it was a computer based				
sequence	randomisation, but no details are provided ("Infants were					
generation	randomly assigned, in a 1.1 ratio, to receive three 2-ml oral					
		doses of vaccine or visibly indistinguishable placebo").				
Allocation	unclear	Likely adequate, but not reported.				
concealment						
Blinding	adequate	Blinding was maintained throughout the study for study				
		investigators, study personnel, parents.
